1948 PULPWOOD PRODUCTION BY COUNTY IN THE SOUTHEAST

by

James W. Cruikshank, Chief

Division of Forest Economics

SOUTHEASTERN FOREST EXPERIMENT STATION
ASHEVILLE, NORTH CAROLINA

I.T. HAIG, Director

PREFACE

Through the McSweeny-McNary Act of 1928, Congress authorized the Secretary of Agriculture to conduct a comprehensive survey of the forest resources of the United States. The Forest Survey was organized by the Forest Service to carry out the provisions of the Act, and each of the 11 Regional Forest Experiment Stations is responsible for the work in its territory. In the Southeastern States the Forest Survey is an activity in the Division of Forest Economics of the Southeastern Forest Experiment Station, Asheville, North Carolina.

The work of the Survey is divided into five major phases:

1. Inventory. Determination of the extent, location, and condition of forest lands, and the quantity, species, and quality of timber on these lands.
2. Growth. Determination of the current rate of timber growth.
3. Drain. Determination of the amount of industrial and domestic wood used, and the total loss resulting from fire, insects, disease, suppression, and other causes.
4. Requirements. Determination of the current and probable future requirements for forest products by all classes of consumers.
5. Policies and plans. Analysis of the relation of these findings to one another and to other economic factors as a basis for public and private policies and plans of forest land use and management.

This progress report summarizes information on the 1948 production of pulpwood obtained in the course of compiling forest drain statistics by states and survey units.

ACKNOWLEDGMENT

The production statistics contained in this release could not have been obtained without the help of all the pulp companies drawing wood from the southeastern states. The author gratefully acknowledges the generous assistance of the wood procurement officials who provided the information on pulpwood production by source. At the Southeastern Station James F. McCormack, Mrs. Christine Paxton, Miss Camilla Young, and Miss Priscilla Walker assisted in summarizing the individual company reports.

1948 PULPWOOD PRODUCTION BY COUNTY IN THE SOUTHEAST

In 1948 total pulpwood production in the five states of the Southeast was 6.3 million cords, an all-time high. Production was 31 percent above 1947 and 34 percent above 1946. Softwoods accounted for 5,565,200 cords, or 88 percent of production; hardwoods for 486,800 cords, and chestnut for 281,000 cords. Production was greatest in Georgia, where 1,770,600 cords were harvested (fig. 2).

All volumes are reported in terms of the 128 cubic-foot standard cord. The softwood volume includes all of the southern yellow pines and a small amount of white pine. Most of the hardwood is blackgum and sweetgum, with the remainder chiefly soft maple, yellow-poplar, and various species of oak. The chestnut is practically all dead timber. Not included are 4,500 cords of slabs and 7,400 cords of veneer cores used for pulp.

These data are based upon reports obtained from the wood procurement officials representing 43 mills located in, or drawing wood from, the five states of the southeast. Reports showed either production by county or by shipping points which were used to assign production to counties. County data are approximate, but totals for small groups of counties should have little error.
